

14.3 Partial Derivatives

1. Let $\mathbf{f}(\mathbf{x}, \mathbf{y})$ be a function of two variables, where $\mathbf{y} = \mathbf{b}$ is fixed. Then $\mathbf{g}(\mathbf{x}) = \mathbf{f}(\mathbf{x}, \mathbf{b})$ is a function of a single variable \mathbf{x} . If \mathbf{g} has a derivative at \mathbf{a} , then we call it the partial derivative of \mathbf{f} with respect to \mathbf{x} at (\mathbf{a}, \mathbf{b}) and write

$$\mathbf{f}_x(\mathbf{a}, \mathbf{b}) = \mathbf{g}'(\mathbf{a}).$$

2. Now keep $\mathbf{x} = \mathbf{a}$ fixed, and let $\mathbf{h}(\mathbf{y}) = \mathbf{f}(\mathbf{a}, \mathbf{y})$. If \mathbf{h} has a derivative at \mathbf{b} , then we call it the partial derivative of \mathbf{f} with respect to \mathbf{y} at (\mathbf{a}, \mathbf{b}) and write

$$\mathbf{f}_y(\mathbf{a}, \mathbf{b}) = \mathbf{h}'(\mathbf{b}).$$

3. By the definition of a derivative, we have

$$\begin{aligned}\mathbf{f}_x(\mathbf{a}, \mathbf{b}) &= \lim_{h \rightarrow 0} \frac{\mathbf{f}(\mathbf{a} + h, \mathbf{b}) - \mathbf{f}(\mathbf{a}, \mathbf{b})}{h}, \\ \mathbf{f}_y(\mathbf{a}, \mathbf{b}) &= \lim_{k \rightarrow 0} \frac{\mathbf{f}(\mathbf{a}, \mathbf{b} + k) - \mathbf{f}(\mathbf{a}, \mathbf{b})}{k}.\end{aligned}$$

The partial derivatives of $\mathbf{f}(\mathbf{x}, \mathbf{y})$ are the functions $\mathbf{f}_x(\mathbf{x}, \mathbf{y})$ and $\mathbf{f}_y(\mathbf{x}, \mathbf{y})$ obtained by letting the point (\mathbf{a}, \mathbf{b}) vary.

4. Notation: If $\mathbf{z} = \mathbf{f}(\mathbf{x}, \mathbf{y})$, then we may write

$$\begin{aligned}\mathbf{f}_x(\mathbf{x}, \mathbf{y}) &= \mathbf{f}_x = \frac{\partial \mathbf{f}}{\partial \mathbf{x}} = \frac{\partial}{\partial \mathbf{x}} \mathbf{f}(\mathbf{x}, \mathbf{y}) = \frac{\partial \mathbf{z}}{\partial \mathbf{x}} = \mathbf{f}_1 = \mathbf{D}_1 \mathbf{f} = \mathbf{D}_x \mathbf{f}, \\ \mathbf{f}_y(\mathbf{x}, \mathbf{y}) &= \mathbf{f}_y = \frac{\partial \mathbf{f}}{\partial \mathbf{y}} = \frac{\partial}{\partial \mathbf{y}} \mathbf{f}(\mathbf{x}, \mathbf{y}) = \frac{\partial \mathbf{z}}{\partial \mathbf{y}} = \mathbf{f}_2 = \mathbf{D}_2 \mathbf{f} = \mathbf{D}_y \mathbf{f}.\end{aligned}$$

5. To find \mathbf{f}_x regard \mathbf{y} as a constant and differentiate $\mathbf{f}(\mathbf{x}, \mathbf{y})$ with respect to \mathbf{x} . To find \mathbf{f}_y regard \mathbf{x} as a constant and differentiate $\mathbf{f}(\mathbf{x}, \mathbf{y})$ with respect to \mathbf{y} .
6. If $\mathbf{f}(\mathbf{x}, \mathbf{y}) = \mathbf{x}^2 + 3\mathbf{x}^3\mathbf{y} - \mathbf{x}\mathbf{y}^2$ find $\mathbf{f}_x(0, 1)$ and $\mathbf{f}_y(1, 0)$.

7. Find $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$ for the following functions.

$$f(x, y) = \frac{2y}{y + \cos x}$$

$$f(x, y) = e^{x^2+y^2+1}$$

$$f(x, y) = \ln(x^4 + 2y^3)$$

8. Find $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ if z is defined implicitly as a function of x and y by the equation

$$x^3 + y^3 + z^3 + 6xyz = 1.$$

9. Interpretations: Partial derivative can be interpreted as rates of change. The geometric interpretation: the partial derivatives are the slopes of the tangent lines at $\mathbf{P}(\mathbf{a}, \mathbf{b}, \mathbf{c})$ to the curves given by the intersection of the surface given by $z = \mathbf{f}(\mathbf{x}, \mathbf{y})$ and the planes $\mathbf{x} = \mathbf{a}$ and $\mathbf{y} = \mathbf{b}$.
10. If \mathbf{f} is a function of two variables, then its partial derivatives \mathbf{f}_x and \mathbf{f}_y are also functions of two variables.
11. Second Partial: The second partial derivatives of \mathbf{f} are

$$\begin{aligned}(\mathbf{f}_x)_x &= \mathbf{f}_{xx} = \mathbf{f}_{11} = \frac{\partial}{\partial x} \left(\frac{\partial \mathbf{f}}{\partial x} \right) = \frac{\partial^2 \mathbf{f}}{\partial x^2} = \frac{\partial^2 z}{\partial x^2} \\(\mathbf{f}_x)_y &= \mathbf{f}_{xy} = \mathbf{f}_{12} = \frac{\partial}{\partial y} \left(\frac{\partial \mathbf{f}}{\partial x} \right) = \frac{\partial^2 \mathbf{f}}{\partial y \partial x} = \frac{\partial^2 z}{\partial y \partial x} \\(\mathbf{f}_y)_x &= \mathbf{f}_{yx} = \mathbf{f}_{21} = \frac{\partial}{\partial x} \left(\frac{\partial \mathbf{f}}{\partial y} \right) = \frac{\partial^2 \mathbf{f}}{\partial x \partial y} = \frac{\partial^2 z}{\partial x \partial y} \\(\mathbf{f}_y)_y &= \mathbf{f}_{yy} = \mathbf{f}_{22} = \frac{\partial}{\partial y} \left(\frac{\partial \mathbf{f}}{\partial y} \right) = \frac{\partial^2 \mathbf{f}}{\partial y^2} = \frac{\partial^2 z}{\partial y^2}.\end{aligned}$$

12. Find all second partial derivatives of

$$\mathbf{f}(\mathbf{x}, \mathbf{y}) = \mathbf{x}^3 + \mathbf{x}^2 \mathbf{y}^3 - 2\mathbf{y}^2$$

13. Clairaut's Theorem: Suppose \mathbf{f} is defined on a disk \mathbf{D} that contains the point (\mathbf{a}, \mathbf{b}) . If the functions \mathbf{f}_{xy} and \mathbf{f}_{yx} are both continuous on \mathbf{D} , then

$$\mathbf{f}_{xy}(\mathbf{a}, \mathbf{b}) = \mathbf{f}_{yx}(\mathbf{a}, \mathbf{b}).$$

14. Calculate f_{xxy} if $f(x, y) = \sin(3x^2 + xy)$.

15. Find the partial derivatives of $f(x, y) = \int_x^y e^{t^2+t+1} dt$.

16. Find f_x , f_y , f_{xy} , f_{yx} for $f(x, y) = xye^{3xy}$.
